Professional Learning Plan

Assessment Task 1 | Name: Dongwoo Won | Student ID: 25623683

Based on the audit you have just completed you will need to select 1-2 area/s to develop during this subject.

If you have completed a professional certification, that aligns with one of your goals and meets certain criteria, you may be able to receive recognition for this.

*** Goals marked with an asterisks are required. If you already have evidence for any of the required goals please note it in the relevant table below.**

The evidence may need to be submitted as part of your portfolio.

You may need to reword the skills/ criteria into clear goals.

* Goal 1: Demonstrate understanding of ethical principles and practices in a professional context, especially in relation to Indigenous Communities

Consideration	Evidence or Plan
What existing evidence do you already have (if any)?	Across my UTS studies I have encountered academic integrity, privacy and professional responsibility. However, I do not yet have strong evidence showing how I would apply ethical practice specifically when working with Indigenous communities or Indigenous data.
What skills or knowledge do you need to gain?	Ethical decision-making and the ACS Code of Ethics; cultural safety and respectful consultation; Indigenous data sovereignty; privacy, consent and responsible data handling; recognising bias and power imbalances in technology projects.
What specific steps (and learning resources) will you take to fill this gap?	1. Weeks 3-4: Complete the two relevant ethics/Indigenous professional-practice modules provided in 43030 (25 h). 2. Week 5: Review the ACS Code of Ethics and the Indigenous-focused readings/resources supplied in the modules; prepare annotated notes (8 h). 3. Week 6: Apply the principles to a cybersecurity case study involving collection, access and sharing of community data (8 h). 4. Week 7: Produce a short reflection and a practical checklist for respectful stakeholder engagement and data handling (4 h).
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	Approximately 45 hours: subject modules 25 h; readings and notes 8 h; case-study analysis/reflection 8 h; final checklist and portfolio evidence 4 h.
Additional information (if required)	Evidence will include module completion, annotated notes, the case-study reflection and the final ethical-practice checklist.

UTS CRICOS PROVIDER CODE 00099F

* Goal 2: Demonstrate foundational skills in Cybersecurity

Consideration	Evidence or Credible Plan
What existing evidence do you already have?	I am currently completing the Bachelor of Cybersecurity at UTS. Under the template instructions, my Cybersecurity degree/major is accepted as evidence for this required goal, so no additional learning plan is required here.
What skills or knowledge do you need to gain?	Not applicable. The template states that students completing a Cybersecurity degree or major do not need to complete the fields below for this goal.
What specific steps (and learning resources) will you take to fill this gap?	Not applicable - this required foundational goal is evidenced by my current Bachelor of Cybersecurity studies at UTS.
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	N/A. No additional 40-50 hour learning activity is required for this goal because the degree/major is accepted as the evidence.
Additional information (if required)	Degree evidence only. I will continue developing these skills through my enrolled Cybersecurity subjects, but no separate portfolio evidence is required for Goal 2.

* Goal 3: Demonstrate foundational skills in Software Development Tools

Consideration	Evidence or Credible Plan
What existing evidence do you already have?	I have completed UTS programming and web-development subjects and have produced coursework using Java, Python and web technologies. This gives me a foundation in coding and debugging, but my use of professional software-development workflows is still limited.
What skills or knowledge do you need to gain?	Git-based version control and branching; Linux command-line workflow; debugging and unit testing; dependency/environment management; secure coding, README documentation and reproducible project setup.
What specific steps (and learning resources) will you take to fill this gap?	1. Week 4: Complete the Software Development Tools module included in 43030 (18 h). 2. Week 5: Practise Git branching, commits and Linux command-line workflows while setting up a small Python security log-parser project (8 h). 3. Weeks 6-7: Implement the project, add automated tests and practise debugging in a Linux environment (14 h). 4. Week 8: Document installation, usage, limitations and secure-coding decisions in a README, then review the project against a code-quality checklist (5 h).
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	Approximately 45 hours: subject module 18 h; Git/Linux practice 8 h; project implementation 14 h; testing, documentation and review 5 h.
Additional information (if required)	Success evidence: working project, Git history, tests, README and a short reflection on improvements to my development workflow.

UTS CRICOS PROVIDER CODE 00099F

Goal 4: Develop practical network and security operations capability to SFIA Level 3 for an entry-level Network & Security / Cyber Security role

Consideration	Evidence or Credible Plan
What existing evidence do you already have?	My UTS Network Fundamentals and Cybersecurity study has given me a foundation in TCP/IP, DNS, packet analysis and security concepts. I have completed guided security labs, but I still need more job-focused experience with enterprise monitoring, incident handling and network-security tooling.
What skills or knowledge do you need to gain?	Network support (SFIA NTAS): switching, routing, monitoring and troubleshooting; Security operations (SCAD): SIEM/EDR alert triage and operational security tooling; Incident management (USUP): investigation, escalation, documentation and recovery; Vulnerability assessment (VUAS): basic scanning, prioritisation and remediation; Information security (SCTY): security controls, cloud/IAM concepts and frameworks; Scripting/automation (PROG): Python or PowerShell for repeatable operational tasks.
What specific steps (and learning resources) will you take to fill this gap?	1. Weeks 4-5: Cisco Skills for All / Networking Academy - revise CCNA networking topics and complete at least five Packet Tracer troubleshooting labs (18 h). 2. Week 6: Microsoft Learn - complete introductory Microsoft Sentinel, Defender and Entra ID security modules and record key configuration/triage notes (10 h). 3. Weeks 7-8: Complete at least three legal SOC/incident-response labs, such as TryHackMe SOC activities, and document alert triage, evidence, escalation and remediation (12 h). 4. Week 9: Review the ACSC Essential Eight and complete a small vulnerability-assessment/remediation exercise in a lab environment (5 h). 5. Week 10: Complete a capstone investigation and produce a one-page incident report, a short runbook and one small Python/PowerShell automation script (5 h).
How many hours will this take? *As a rough guide it should be the equivalent of at least 40-50 hours or learning (2 Credit Points).*	Approximately 50 hours: Cisco/Packet Tracer 18 h; Microsoft Learn 10 h; SOC labs 12 h; Essential Eight and vulnerability exercise 5 h; capstone report/runbook/automation 5 h.
Additional information (if required)	Success measures: at least 80% on module quizzes; 5 Packet Tracer labs; 3 documented SOC investigations; 1 vulnerability-remediation exercise; 1 incident report/runbook; and 1 small automation script. The target is SFIA Level 3 (Apply) in the core operational skills identified in the Dream Jobs Skills Audit.

UTS CRICOS PROVIDER CODE 00099F

Dream Jobs Skills Audit

Assessment Task 1: Professional Learning Plan | Name: Dongwoo Won | Student ID: 25623683

Selected dream jobs

Job	Employer	Location / type	Recent ad evidence	Why it matters
Junior Network & Security Engineer	Marble Arch Consulting	Alexandria, Sydney NSW; full-time, hybrid	$100,000 package; posted 5 days before access	Entry-level bridge between CCNA networking, monitoring, incident handling and security platforms.
Junior Cyber Security Engineer	BizCover	Sydney NSW; full-time, hybrid	$85,000-$95,000; posted 3 weeks before access	Shows the next-step expectations for enterprise security operations, IAM, cloud security and vulnerability management.

Why I selected these jobs

1. Both roles match my intended pathway into network/security engineering and cyber security operations. They combine technical infrastructure knowledge with hands-on defensive security rather than focusing only on policy or governance.
2. The advertisements reveal a consistent set of skill gaps that I can address during this subject: network troubleshooting, monitoring and alert triage, incident response, vulnerability management, enterprise security controls, and scripting/automation.
3. The two jobs also show a realistic progression. Marble Arch accepts early-career experience or CCNA-level knowledge and provides platform training, while BizCover expects broader independent security-operations experience. This gives me a practical short-term entry target and a stronger next-step target.
4. Both advertisements are recent Australian IT roles with explicit technical criteria, so they provide current evidence of what employers are asking from junior network and cyber security candidates.

SFIA 9 skills gap analysis

The ratings below are a self-assessment against SFIA 9 levels of responsibility. SFIA Level 2 (Assist) involves supervised support and routine problem-solving; Level 3 (Apply) involves completing varied work under general direction and managing one's own tasks. My target is mainly Level 3 because the selected jobs require practical ownership of tickets, investigations and technical tasks, with escalation when needed.

Key skill / SFIA code	Evidence from the two job ads	Current level and justification	Gap, target and action point
Network support (NTAS)	Marble Arch: switching, routing, network monitoring, troubleshooting and CCNA-level knowledge. BizCover: networking and firewall knowledge as part of security operations.	Level 2 - Assist. Network Fundamentals and guided DNS/packet-analysis labs give me basic troubleshooting knowledge, but I have not yet supported a production network independently.	Target Level 3. Complete CCNA revision plus 5 Packet Tracer troubleshooting labs; document faults, diagnosis, fix and escalation decisions.
Security operations (SCAD)	Marble Arch: monitor customer environments and triage alerts. BizCover: SIEM, EDR, firewalls and other security platforms; monitor events and investigate incidents.	Level 1 - Follow. I can complete structured security labs and interpret basic packet/log evidence, but I do not yet have live SOC or enterprise tooling experience.	Target Level 3. Complete Microsoft Sentinel/Defender learning and 3 SOC labs; produce investigation notes and a reusable triage checklist.
Incident management (USUP)	Marble Arch: initial incident response, ticket ownership, handovers and escalation. BizCover: incident triage, root-cause analysis and remediation.	Level 1 - Follow. I have investigated scenarios in guided university labs but have not owned real incidents or worked within an operational incident process.	Target Level 3. Practise detection-to-closure workflows in SOC labs; write one incident report and one runbook covering triage, escalation, containment and recovery.
Vulnerability assessment (VUAS)	BizCover explicitly requires vulnerability management, assessments and remediation; Marble Arch requires security troubleshooting across customer environments.	Level 2 - Assist (academic/lab evidence). I understand common weaknesses and can follow guided security exercises, but I have limited experience scoping, prioritising and remediating vulnerabilities.	Target Level 3. Run a low-risk lab vulnerability assessment, classify findings, prioritise them, apply fixes and verify remediation.

UTS CRICOS PROVIDER CODE 00099F

Key skill / SFIA code	Evidence from the two job ads	Current level and justification	Gap, target and action point
Information security (SCTY)	BizCover: IAM, cloud security, risk assessments and ISO 27001/NIST/SOC 2. Marble Arch: security platforms, standard changes and operational processes.	Level 2 - Assist. My Cybersecurity degree provides foundation knowledge of security principles and controls, but I need stronger experience applying them to enterprise/cloud environments.	Target Level 3. Study Essential Eight plus Microsoft Entra/Defender concepts; map controls to a small lab and explain implementation choices.
Programming / software development (PROG)	Both advertisements treat scripting/automation as useful: Marble Arch lists scripting or automation; BizCover lists PowerShell or Python as a bonus.	Level 2 - Assist. I have completed programming coursework using Java and Python and can build/debug simple programs, but I need more operational automation practice.	Target Level 3. Build a small Python or PowerShell security automation script, manage it with Git, add tests and document its use and limitations.

The opportunity

Marble Arch Consulting Group (MAC) is seeking a Junior Network & Security Engineer to join our Managed Services team in Alexandria, Sydney.

This is an excellent opportunity for someone with early-career networking experience—or solid CCNA-level knowledge—who wants to develop practical skills across networking, cybersecurity, wireless and managed services.

You'll monitor customer environments, investigate alerts, resolve incidents and service requests, and implement standard changes. You'll work alongside experienced engineers who can support you when issues need escalation, while building the skills and confidence to take greater ownership over time.

You don't need experience with every platform listed in this advert. We're looking for sound networking fundamentals, practical problem-solving ability and a genuine interest in developing your career.

The position offers a remuneration package of **$100,000, including superannuation**.

What you'll be doing

- Monitor customer network and security environments and triage alerts
- Provide an initial response to incidents and service requests
- Troubleshoot issues and escalate to senior engineers or vendors when required
- Take ownership of assigned tickets and provide clear, timely updates
- Implement standard and pre-approved changes
- Follow established incident, change and problem-management processes
- Create and maintain knowledge articles, runbooks and operating procedures
- Add and maintain customer devices within monitoring platforms
- Provide accurate written handovers for open incidents and changes
- Assist with solution implementations, testing and technical documentation
- Provide post-implementation support for solutions moving into production
- Build productive relationships with customers and colleagues
- Contribute ideas to improve MAC's managed services

Student-supplied job advertisement screenshot, accessed 24 Aug 2026.

Selection criteria and role details used in the skills audit

Marble Arch Consulting describes the role as an early-career managed-services position for someone with practical networking experience or solid CCNA-level knowledge. The engineer monitors customer network and security environments, triages alerts, provides an initial response to incidents and service requests, troubleshoots issues, owns assigned tickets, implements standard changes, and maintains technical documentation and handovers.

Core selection criteria include either one to three years of hands-on network/security infrastructure support or CCNA-level knowledge; experience with network monitoring and ticketing/ITSM; basic switching, routing and troubleshooting; systematic problem solving; clear written and verbal communication; and the ability to remain effective during incidents. Helpful exposure includes Cisco/Aruba, Fortinet/Palo Alto/Zscaler, SolarWinds/PRTG, ServiceNow, SD-WAN, ITIL and scripting/automation.

Key criteria used in my audit

- CCNA-level networking: switching, routing and troubleshooting.
- Network/security monitoring and alert triage.
- Initial incident response, escalation, ticket ownership and written handover.
- Security platform exposure, including firewall technologies.
- IT service-management processes and technical documentation.
- Scripting/automation as a useful additional capability.

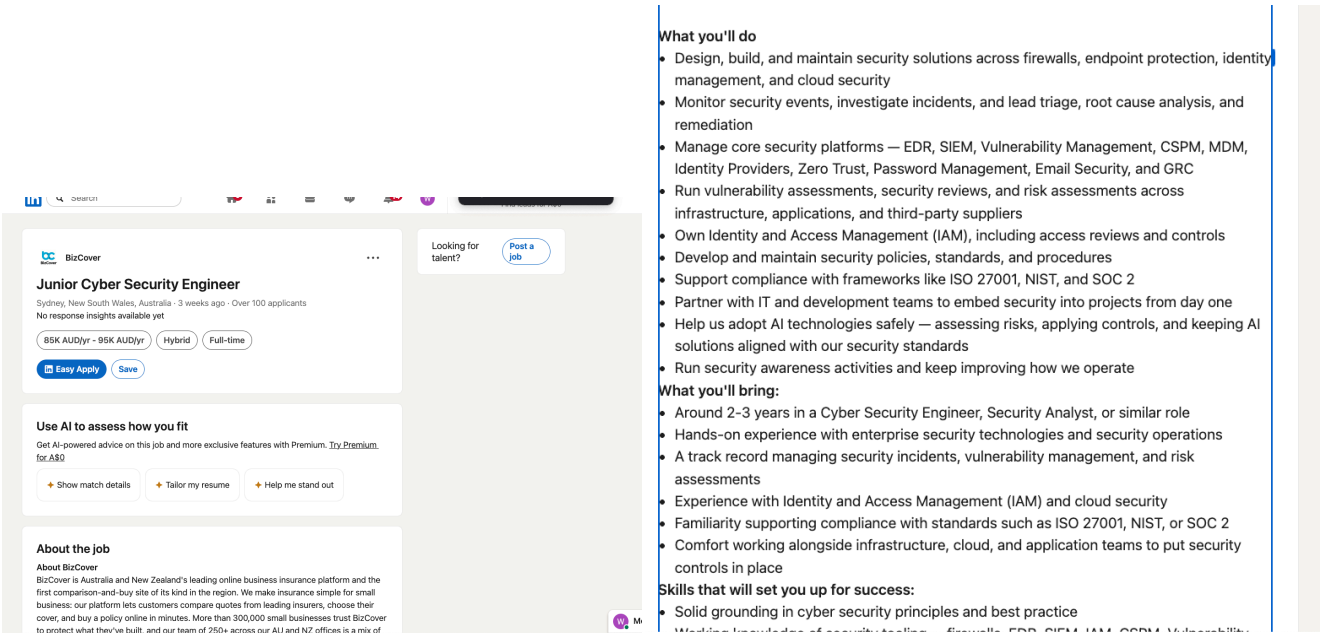

Why this is a dream-job target: it is a realistic first professional step because it combines networking and cyber security, values CCNA-level knowledge, and explicitly offers training across enterprise technologies.

About the job

About BizCover

BizCover is Australia and New Zealand's leading online business insurance platform and the first comparison-and-buy site of its kind in the region. We make insurance simple for small business: our platform lets customers compare quotes from leading insurers, choose their cover, and buy a policy online in minutes. More than 300,000 small businesses trust BizCover to protect what they've built, and our team of 250+ across our AU and NZ offices is a mix of

What you'll do

- Design, build, and maintain security solutions across firewalls, endpoint protection, identity management, and cloud security
- Monitor security events, investigate incidents, and lead triage, root cause analysis, and remediation
- Manage core security platforms — EDR, SIEM, Vulnerability Management, CSPM, MDM, Identity Providers, Zero Trust, Password Management, Email Security, and GRC
- Run vulnerability assessments, security reviews, and risk assessments across infrastructure, applications, and third-party suppliers
- Own Identity and Access Management (IAM), including access reviews and controls
- Develop and maintain security policies, standards, and procedures
- Support compliance with frameworks like ISO 27001, NIST, and SOC 2
- Partner with IT and development teams to embed security into projects from day one
- Help us adopt AI technologies safely — assessing risks, applying controls, and keeping AI solutions aligned with our security standards
- Run security awareness activities and keep improving how we operate

What you'll bring:

- Around 2-3 years in a Cyber Security Engineer, Security Analyst, or similar role
- Hands-on experience with enterprise security technologies and security operations
- A track record managing security incidents, vulnerability management, and risk assessments
- Experience with Identity and Access Management (IAM) and cloud security
- Familiarity supporting compliance with standards such as ISO 27001, NIST, or SOC 2
- Comfort working alongside infrastructure, cloud, and application teams to put security controls in place

Skills that will set you up for success:

- Solid grounding in cyber security principles and best practice

Student-supplied job advertisement screenshot, accessed 24 Aug 2026.

Selection criteria and role details used in the skills audit

BizCover's junior cyber security engineering role covers security solutions across firewalls, endpoint protection, identity management and cloud security. Responsibilities include monitoring security events, investigating incidents, performing triage and remediation, managing enterprise security platforms, running vulnerability and risk assessments, supporting IAM, maintaining policies and procedures, and supporting frameworks such as ISO 27001, NIST and SOC 2.

The advertisement asks for hands-on enterprise security-operations experience, incident and vulnerability management, IAM and cloud-security experience, familiarity with compliance frameworks, and the ability to work with infrastructure, cloud and application teams. It also values knowledge of EDR, SIEM, firewalls and other security tooling, along with networking and operating-system knowledge. Python or PowerShell automation is listed as a bonus, and analytical problem-solving and clear communication are emphasised.

Key criteria used in my audit

- Enterprise security operations using SIEM, EDR, firewall and related tooling.
- Security incident investigation, triage, root-cause analysis and remediation.
- Vulnerability management and risk assessment.
- Identity and access management plus cloud security.
- Security frameworks and controls, including ISO 27001 and NIST.
- Networking/operating-system knowledge and Python or PowerShell automation.

Why this is a dream-job target: it represents the next step after building operational networking/security experience and shows the broader enterprise capabilities I need to become a well-rounded cyber security engineer.
